Table of contents

1 Current Version.....	2
2 Legacy Versions.....	2

1 Current Version

The current release version of the New Testament names in OWL is composed of two data files.

-  [NTNames.owl](#) is the ontology definition (classes and properties), separated out to support re-use.
-  [NTN-individuals.owl](#) is a larger file, comprised only of instance data.

This release has a complete set of names for the Woman class (48 in all), an incomplete set of names for Man, with relationship data for native/resident/visitedPlace, spouse/childOf, and religiousBelief. It also has latitude and longitude properties for City instances.

If you're seriously interested in looking at the data, i strongly recommend [the Protege editor](#) (you also need the OWL plug-in).

2 Legacy Versions

These legacy versions are still available but now deprecated:

- the 2005/09 version is composed of two data files as described above:  [NTNames.owl](#) and  [NTN-individuals.owl](#). This release has a complete set of names for the Woman class (48 in all), an incomplete set of names for Man, with relationship data for native/resident/visitedPlace, spouse/childOf, and religiousBelief.
-  [the 2004/09 version](#)
-  [the initial version \(2004/04\)](#)
